

Application Program Interface (API) Provided by AccountMate Professional Services Group

The right Application Program Interface (API) will make it easier to interface programs to AccountMate's data files and reduce development time substantially.

The API's are designed to allow any external application to write information into AccountMate; information is validated before it is committed to the company database and errors are returned to the calling application if any are found. The API's follow AccountMate's business rules and logic, so as a developer, you don't need to know how to update the data manually.

The API's can be licensed by any currently authorized AccountMate vertical solution provider that wants to integrate their application with AccountMate, or a web site integrator that wants to link their web site with AccountMate, or an authorized AccountMate Business Partner looking to automate integration with custom solutions.

AccountMate has created APIs for many of the SQL 9.3 through 10.x accounting modules. The API's are available in compiled and source, and with the addition of Life Cycle Maintenance can be kept current as new versions and builds release. This will enable you to more easily move your clients or vertical solutions to newer versions of AccountMate.

The APIs are available for licensing through AccountMate's Professional Services Group (PSG). If you are interested in learning about these APIs and how they may reduce your development time, contact PSG at psg@accountmate.com. They can help you determine if APIs are the best alternative to deliver your solution to clients.
